Technical Field

20

This invention relates to managing multiple web servers, and more particularly to a web service system that allows a system operator to collect content from each web server to a single computer in the web service system.

Background Information

25

In a computer network environment, web servers are used to respond to users' web page requests, which are transmitted over the computer network. Web page requests, also referred to as content requests, typically are made by a browser running on a user's computer. A web server monitors one or more computer network address/port endpoints for web page requests and responds to the web page requests by transmitting web pages to the requester. Web servers may be special purpose devices, or they may be implemented with a software program running on a general purpose computer. The service capacity of a web server limits the number of web page requests that may be received and responded to in a given time interval.

30

A web service system may include one web server or more than one web server.
